

## **ABSTRACT OF THE DISCLOSURE**

The cable television (CATV) jack is a surface mount jack and provides an aesthetically pleasing device for routing communications cables. An extra length of cable may be stored inside the jack, and there are multiple ports on the surfaces of the jack to provide several options for cable connections. The jack has at least one port for entry of an input cable and at least one double female connector extending out from an extension port in the jack for securing an output cable. The jack securely retains the cable and connectors to prevent broken connections. The jack is easily mounted to a surface using screws, or other means, such as adhesive.
